Cross Site Request Forgery

Suyash A Gunjal

What is Cross Site Request Forgery?

Cross Site Request Forgery is considered as one of top

vulnerability in today's web, where an untrusted website can force the user browser to send the unauthorized valid request to the trusted site.

Cross-Site Request Forgery (CSRF) is a type of web security vulnerability where an attacker tricks an authenticated user's browser into unintentionally sending unauthorized requests to a trusted web application. Since the user is already logged in, the application treats the malicious request as legitimate, allowing attackers to perform actions such as changing account details, transferring funds, or altering settings without the user's knowledge.

Prevention Points For CSRF:

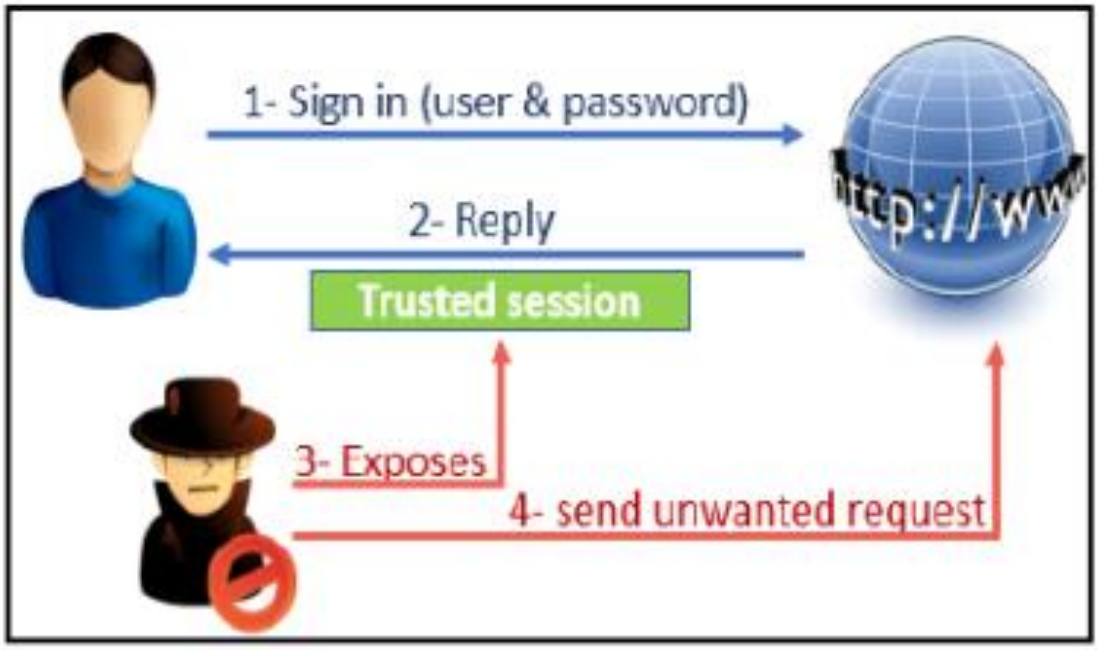
CSRF Tokens - Use unique, unpredictable tokens in forms and requests to verify authenticity.

SameSite Cookies - Set cookies with the SameSite attribute to block cross-origin requests.

Re-authentication - Ask users to re-enter passwords or OTPs for sensitive actions.

Verify Request Origin - Check request headers (Origin/Referer) to ensure they come from the same trusted domain.

Structure of Cross Site Request Forgery:



1. User signs in → Enters username & password on a trusted website.

2. Trusted session created → Website replies and keeps the user logged in.

3. Attacker exploits session → The attacker tricks the user (e.g., via malicious link).

4. Unwanted request sent → User's active session is misused to perform unauthorized actions.
